At a glance

The increasing complexity of systems brings with it an increase in the challenges facing T&M systems. The digital mixed signal oscilloscopes in the R&S®HMO compact series unify high sensitivity and multifunctionality with an attractive price. The wide range of applications and measurement functions address a broad group of users – from embedded developers to service technicians to educators. Advanced, powerful technology in a compact design meets the high requirements of today's customers.

The 2- and 4-channel instruments offer bandwidths of 70 MHz, 100 MHz, 150 MHz and 200 MHz, a sampling rate of 2 Gsample/s and a memory depth of 2 Msample. Featuring MSO functionality as standard and a variety of options for serial bus analysis, the instruments meet the demands of modern design development.

Rohde & Schwarz offers the R&S®HMO compact series exclusively as mixed signal oscilloscopes. Unlike other manufacturers' instruments, the mixed signal functions are not activated via software options. The only optional extra is the R&S®HO3508 low-capacitance logic probe that analyzes signals with a sampling rate of 1 Gsample/s on up to 8 logic channels. The probe is not tied to the instrument serial number and can be used with any of the R&S®HMO oscilloscopes.

For communications between embedded systems and the environment, hardware-based signal triggering and decoding for all common protocols (I2C, SPI, UART, CAN and LIN) has been integrated. It can be activated with an upgrade voucher at any time.

Thanks to the integrated 64k point FFT analysis function, the R&S®HMO compact series competes with significantly larger oscilloscopes in the frequency domain. The time domain signal, measurement window and FFT results are displayed on a single screen, which makes it easier to analyze the input signal waveform.

The R&S®HMO compact series offers time domain, logic, protocol and frequency analysis plus an advanced component tester in a single, compact instrument. It is a member of the Rohde & Schwarz scope-of-the-art family.

Functions for everyday use

The intelligent screen design hides menus when these are not in use. This allows a maximum display area for measurement data, despite the extremely compact instrument dimensions.

QuickView you will also receive a comfort feature that allows to get a quick overview of the measured waveform. By pressing a single button to activate the automatic analysis the results are displayed directly at the signal and on the bottom of the screen.

Pattern Generator

The HMO Compact Series includes a 4 bit wide bus signal source. Thereby predefined I²C, SPI, UART signal patterns as well as pseudo random patterns and counter signals are provided.

Component Tester

Our time proven component tester will also be at your side. Two measuring frequencies with 50 Hz or 200 Hz are provided to support your potentially tedious search for faulty components. And since a picture truly does say more than a thousand words, you will be able to tell at a glance if your error analysis is on track.

Always a MSO

The mixed signal functionality is always included in the R&S®HMO Compact Series with no software option being necessary to unlock it.

Rohde & Schwarz is offering the R&S®HMO Compact Series exclusively as mixed-signal oscilloscopes. The great advantages of these instruments are best illustrated by taking a look at how ADCs (Analog Digital Converter) or DACs (Digital Analog Converter) are integrated.

These transformer modules include an analog signal on the one side and a digital signal on the other side. As shown in the image below the latency time of a DAC can be determined with one simple cursor measurement. Therefore a MSO allows developers to devote their full attention to the circuit without having to waste energy on the measurement setup.

The active logic probe R&S®HO3508 is available separately and is not linked to a specific serial number of an instrument. It can be used with any R&S®HMO oscilloscope.

Frequency Analysis

Due to the outstanding FFT functionality of the R&S®HMO series oscilloscopes signals can also be analysed in the frequency domain with up to 65,536 points. Additional practical tools such as cursor measurement as well as peak-detect-functions are also available. They allow engineers to complete their analysis significantly faster, also in the frequency domain.

Figure 1: A sinusoid signal that at first sight appears undistorted

Easy analysis in frequency domain

Quite often the distortion of input signals cannot be detected with the naked eye. For instance, the sine wave signal displayed in figure 1 appears to be undistorted. Only the frequency spectrum (figure 2) - available with just one touch of a button - clearly displays additional harmonics that occur as harmonic oscillations for multiples of the basic frequency.

Figure 2: The frequency spectrum exposes the signal distortion

For non-periodic input signals most instruments offer the option to trigger the spectrum at just the right moment to then check it in "STOP" mode at a later time. However, at that point, many oscilloscopes with FFT functionality calculate the spectrum only once and store the result in the memory. The base time signal will no longer be used for the calculation. Consequently, an investigation of all parts of the signal will no longer be possible.

Figure 3: Sine burst signal in time domain

R&S®HMO series oscilloscopes work differently: Since FFT is also active for previously stored signals, it is possible to subsequently analyze any sections of those signals captured in single shot mode or stop mode with an adjustable window width. Figure 3 shows a sine burst signal in the time domain. Pushing the FFT button will switch the oscilloscope into the frequency domain. Users can choose between various measurement

Figure 4: FFT analysis of a sine burst signal with rectangular window function

windows like the „rectangular“ type that has been used in figure 4. Although this window type captures frequencies at a high degree of accuracy, it is also accompanied by more noise. In order to suppress this disturbing interference users can for instance choose the Hanning window. The impact on the spectrum is visible in figure 5 (see device screen).
